3. Results

3.1 Sensor Characterization

For the SensorCharacterization.tex file, you'd want to focus on the fundamental properties and performance of your photodiodes themselves, distinct from the other subsections. Here are some key elements that would belong specifically under SensorCharacterization:

- Basic Photodiode Electrical Characteristics:

- Dark current measurements
 - Junction capacitance
 - I-V characteristics in different lighting conditions
 - Spectral response profiles (sensitivity vs. wavelength)

- Individual Sensor Benchmarking:

- Performance comparison between the 4 photodiodes (matching/differences)
 - Responsivity measurements (A/W)
 - Quantum efficiency calculations
 - Detection threshold levels

- Response Linearity:

- Measurements showing linear range of the photodiodes
 - Saturation point characterization
 - Recovery time from saturation

- Temperature Dependency:

- Performance drift with temperature
 - Baseline shift measurements
 - Temperature compensation data

- Aging/Stability Tests:

- Long-term drift measurements
 - Repeatability of measurements over time

This section should focus on the inherent properties of the photodiodes themselves - essentially providing the baseline characterization data that underpins all the other analysis. The other sections then build on this foundation by examining how these sensors perform when integrated into the complete system with amplification, angular positioning, enclosure effects, etc.
